ARIRA AI · AI IMPLEMENTATION

AI Engineer - Tech

Turn AI into real results inside a growing business

We are putting AI to work in the day-to-day operations of our client companies. As an AI Engineer you work on site in our client companies: you sit with their teams, learn how the work is really done, and then use AI tools to build and roll out solutions that make that work faster and better. You are measured by one thing: the value the business gets from AI.

ROLE
AI Implementation

LOCATION
Mumbai or Bangalore

WORK MODEL
On site at client company offices

EMPLOYMENT TYPE
Full-time, permanent

REPORTS TO
Head of Implementation

TRAVEL
Client company offices

Why join

AI that actually gets used

Your work goes live with real business teams. You see the result in how people work, not in a slide deck.

A free hand with the best tools

Full access to our AI assets and the AI tools the job needs, and the freedom to use them properly.

Learn fast, grow faster

A structured start to learn how we work, then real ownership of live deployments, working closely with the leadership team.

AI Engineer - Tech

Mumbai or Bangalore · Vacancy reference AIE-T-2026

WHAT GOOD LOOKS LIKE

Fully onboarded

You know how we work and can run a deployment end to end.

First deployment live

Your first team is using AI in its daily work and can see the difference.

Value shown

Business teams and leaders recognise real gains from what you put in place.

Repeated widely

You carry what works from one team to the next and make each deployment faster.

WHAT YOU WILL DO

01 Work on site at client company offices as the face of the AI programme.

02 Sit with business users, understand how they do their work today and where time and effort are lost.

03 Ask the right questions to draw out how processes really run, including the exceptions.

04 Document workflows, requirements and decisions clearly so others can build on them.

05 Choose the right language models and AI tools for each problem.

06 Build and configure working solutions yourself, from prompts and agents to quick apps.

07 Roll solutions out, train users and help them adopt new ways of working.

08 Follow up after go-live, fix what does not work and keep improving it.

09 Show the business the value it is getting from AI in terms they care about.

10 Feed lessons from each deployment back into how we deploy AI.

REQUIREMENTS

What you bring

- 2 to 5 years of professional experience.
- Hands-on use of different language models and AI tools.
- A working understanding of technology and the software development cycle.
- Experience as a business user of software, close to real operations.
- A product mindset, in a product or project manager style of role.
- A people person: easy to talk to, curious, and good at getting information out of users.
- Clear, accurate documentation.
- Able to join quickly. Shorter notice periods are preferred.
